# Arduino's overview

## Entry-Level Boards

### 1. **Arduino UNO R4 Minima**

- **Price:** ~\$20
- **Main Purpose:** Beginner-friendly board for learning electronics and programming.
- **Capabilities:** HID support (keyboard/mouse emulation), no built-in Wi-Fi or Bluetooth.
- **Memory:** 32 KB SRAM, 256 KB Flash, 8 KB EEPROM.

### 2. **Arduino UNO R4 WiFi**

- **Price:** ~\$27
- **Main Purpose:** Enhanced UNO for IoT and creative projects with wireless features.
- **Capabilities:** Wi-Fi, Bluetooth (via ESP32-S3), HID support, 12x8 LED matrix, Qwiic connector.
- **Memory:** 32 KB SRAM (RA4M1), 512 KB SRAM (ESP32-S3), 256 KB Flash (RA4M1).

### 3. **Arduino Nano Every**

- **Price:** ~\$13
- **Main Purpose:** Compact, affordable board for small projects and prototyping.
- **Capabilities:** No Wi-Fi or Bluetooth, no HID support natively.
- **Memory:** 6 KB SRAM, 48 KB Flash.

#### 4. **Arduino Leonardo**

- **Price:** ~\$25
  - **Main Purpose:** USB-focused projects and HID applications.
  - **Capabilities:** Native USB communication, HID support (can act as keyboard/mouse), no Wi-Fi or Bluetooth.
  - **Memory:** 2.5 KB SRAM, 32 KB Flash, 1 KB EEPROM
- 

## Enhanced Boards

#### 4. **Arduino Mega 2560 Rev3**

- **Price:** ~\$48
- **Main Purpose:** Advanced projects needing many I/O pins and higher memory.
- **Capabilities:** No Wi-Fi or Bluetooth, no HID support natively, 54 digital I/O pins.
- **Memory:** 8 KB SRAM, 256 KB Flash, 4 KB EEPROM.

#### 5. **Arduino Due**

- **Price:** ~\$45
  - **Main Purpose:** High-performance projects requiring 32-bit processing.
  - **Capabilities:** No Wi-Fi or Bluetooth, HID support, DAC for analog output.
  - **Memory:** 96 KB SRAM, 512 KB Flash.
- 

## IoT-Focused Boards

#### 6. **Arduino Nano 33 IoT**

- **Price:** ~\$25

- **Main Purpose:** Small IoT projects with wireless connectivity.
- **Capabilities:** Wi-Fi, Bluetooth, HID support, onboard crypto chip.
- **Memory:** 32 KB SRAM, 256 KB Flash.

## 7. **Arduino Nano 33 BLE**

- **Price:** ~\$28
- **Main Purpose:** IoT and wearable projects with Bluetooth focus.
- **Capabilities:** Bluetooth Low Energy (BLE), HID support, no Wi-Fi, onboard IMU.
- **Memory:** 256 KB SRAM, 1 MB Flash.

## 8. **Arduino Nano ESP32**

- **Price:** ~\$20
- **Main Purpose:** Compact IoT with high-performance ESP32 capabilities.
- **Capabilities:** Wi-Fi, Bluetooth, HID support, MicroPython support.
- **Memory:** 520 KB SRAM, 16 MB Flash (external).

## 9. **Arduino MKR WiFi 1010**

- **Price:** ~\$40
- **Main Purpose:** IoT projects with secure wireless communication.
- **Capabilities:** Wi-Fi, Bluetooth, HID support, onboard crypto chip.
- **Memory:** 32 KB SRAM, 256 KB Flash.

## 10. **Arduino GIGA R1 WiFi**

- **Price:** ~\$75
- **Main Purpose:** Advanced, large-scale projects with multimedia and connectivity.
- **Capabilities:** Wi-Fi, Bluetooth, HID support, dual-core MCU, camera/display support.
- **Memory:** 576 KB SRAM (M7 core) + 256 KB (M4 core), 2 MB Flash.

## 11. **Arduino Portenta H7**

- **Price:** ~\$110
- **Main Purpose:** Industrial-grade, high-performance IoT and AI applications.
- **Capabilities:** Wi-Fi, Bluetooth, HID support, dual-core MCU, high-speed I/O.
- **Memory:** 2 MB SRAM (total), 16 MB Flash (external).

# Temperatuur en luchtvochtigheid

## Temperatuur en luchtvochtigheid

Temperatuur.jpg

## DHT11

image.png

DHT11; van links naar rechts: *signaal* (naar port 2), *3.3V*, *GRND*.

Let op er zijn meerdere varianten en bij de meeste zit de data in het midden.

(<https://elektronicavoorjou.nl/product/dht11-temperatuur-en-vochtigheid-sensor/>)

## Output

```
1
Temperature: 20.5 °C
Humidity:    45 %
2
Temperature: 20.5 °C
Humidity:    45 %
...
```

## Code

```
#include <DHT.h>

#define DHTPIN 2           // Pin connected to the DHT11 data pin
#define DHTTYPE DHT11     // Specify DHT11 sensor

DHT dht(DHTPIN, DHTTYPE);
int count;

void setup() {
  Serial.begin(9600);
```

```
dht.begin();
count = 0;
delay(5000);
}

void loop() {
  count++;
  delay(2000); // Wait 2 seconds between readings (DHT11 needs time)

  float temp = dht.readTemperature(); // Read temperature as a float
  int humidity = dht.readHumidity();

  if (isnan(temp)) {
    Serial.println("Failed to read from DHT sensor!");
  } else {
    Serial.println(count);

    Serial.print("Temperature: ");
    Serial.print(temp, 1);
    Serial.println(" °C");

    Serial.print("Humidity:   ");
    Serial.print(humidity);
    Serial.println(" %");

    Serial.println("");
  }
}
```

# Display

## 1602 LCD Module Display Bundle with I2C interface 2x16 Characters

image.png

## Aansluitschema

image.png

Let op: de pin configuratie verschilt per type Arduino

|               |                                  |
|---------------|----------------------------------|
| Uno, Ethernet | A4 (SDA), A5 (SCL)               |
| Mega2560      | 20 (SDA), 21 (SCL)               |
| Leonardo      | 2 (SDA), 3 (SCL)                 |
| Due           | 20 (SDA), 21 (SCL) of SDA1, SCL1 |

# Thermometer bewegingsmelder en clock

## Thermometer bewegingsmelder en clock

Het display laat de temperatuur en luchtvochtigheid zien en toont de trend met een pijltje omhoog of naar beneden.

Op de tweede regel staat de datum en tijd.

Het display gaat alleen 'aan' als er beweging wordt geconstateerd.

Gemeten stroom is ongeveer 40 mA voor de gehele schakeling.

[Screenshot 2025-03-22 110222.jpg](#)

## Aansuitschema

### *PIR Bewegingsmelder*

shopping.webp

Van onder gezien van links naar rechts

(Let op er zijn verschillende pin configuraties. Verwijder lens/cap om de pin configuratie te zien).

- Plus 5V
- Signaal naar Pin 12 Arduino Leonardo.
- Min

Signaal naar Digitaal pin 12 Arduino Leonardo

### *Clock DS 3231*

Untitled.jpg

Screenshot 2025-03-22 184122.jpg

<http://www.rinkydinkelectronics.com/library.php?id=73>

Van links naar rechts van onderkant (niet batterij kant) gezien en *laatste* 4 pootjes.

- SCL naar SCL op Arduino (op Leonarde meest rechter pin)
- SDA naar SDA op Arduino (op Leonarde op een na meest rechter pin)
- Plus 3.3V
- Min

## Thermometer

*image.png*

Van links naar rechts (gaatjes van blauwe blokje boven).

- naar pin 4 Arduino Leonarde
- Plus 3.3V
- Min

# Arduino projects ideas

## Arduino projects ideas

### 1. LED Blinking Traffic Light

- **Description:** Build a simple traffic light simulation with red, yellow, and green LEDs that cycle in sequence.
- **Learning Objectives:** Digital output, basic timing with `delay()`, and code structure (`setup/loop`).
- **Components:** 3 LEDs, resistors, breadboard, jumper wires.
- **Suggested Board:** Arduino UNO R4 Minima.
- **Code Concept:** Use `digitalWrite()` to turn LEDs on/off with timed delays.
- **Challenge:** Build a second traffic light that interacts with the first and emulates a real crossing.

### 2. Button-Controlled Buzzer

- **Description:** Press a button to make a buzzer play a tone; press again to stop it.
- **Optional:** add a led that shows when the buzzer is playing.
- **Learning Objectives:** Digital input, conditional statements (`if`), basic sound generation.
- **Components:** Pushbutton, buzzer, resistor, breadboard.
- **Suggested Board:** Arduino Nano Every.
- **Code Concept:** Read button state with `digitalRead()` and use `tone()` for sound.

### 3. Temperature Monitor with LCD

- **Description:** Display room temperature on an LCD screen using a temperature sensor.
- **Learning Objectives:** Analog input, sensor interfacing, LCD output.

- **Components:** TMP36 or DHT11 sensor, 16x2 LCD, breadboard.
- **Suggested Board:** Arduino UNO R4 Minima.
- **Challenge:** add a led and/or buzzer that switches on when the temperature is outside of a preset range.

#### 4. **Auto lock PC/Laptop**

- **Description:** Build a system that detects if a user is present at a computer using a motion or distance sensor. If no one is detected for a set time (e.g., 5 minutes), it sends a signal to shut down the PC.
- **Learning Objectives:** Sensor interfacing (analog/digital), timing logic, serial communication, basic PC interaction.
- **Components:** HC-SR04 ultrasonic sensor (distance) or PIR sensor (motion),
- **Suggested Board:** Arduino UNO R4 Minima (simple) or Arduino Nano 33 IoT (for added connectivity).
- **Code Concept:**
  - Use `pulseIn()` (for HC-SR04) or `digitalRead()` (for PIR) to detect presence.
  - Implement a timer with `millis()` to track inactivity.
  - Send a lock command via Serial (software) or toggle a relay (hardware simulation).

### Full name

IdealSpark® ESP32 Development Board Integrated 2.9 cm ST7789 135x240 TFT LCD Display, WiFi+BL Wireless Module, CH340 Driver USB Type-C for Arduino Micropython

### Datasheet

### Board description

The Dual Core 30pin ESP32-WROOM-32S 32d is compatible with the Arduino IDE. To get started, you'll need to install the ESP32 board definitions through the Arduino Board Manager. Here's how:

- 1. Install the Board Package:**

In the Arduino IDE, open *File > Preferences* and add the following URL to the "Additional Boards Manager URLs" field:

```
https://dl.espressif.com/dl/package_esp32_index.json
```

- 2. Use the Board Manager:**

Go to *Tools > Board > Boards Manager*, search for "ESP32," and install the package provided by Espressif.

- 3. Select Your Board:**

Once installed, select the appropriate ESP32 board from *Tools > Board*. Your Dual Core ESP32-WROOM-32S should appear in the list, allowing you to program it using the familiar Arduino environment.

With these steps, you can leverage the Arduino IDE to develop and upload code to your ESP32 board.

Modulenaam in Arduino IDE: *ESP32 Dev Module*

## Char Set

image.png

## Text size

| Text Size ( <code>setTextSize(n)</code> ) | Character Width (px) | Height ? | Characters per Line<br>(240 px / width) |
|---|----------------------|----------|---|
| 1   | 6 px (5 + 1 spacing) | 8 px     | <b>40 chars</b>                         |
| 2   | 12 px                | 16 px    | <b>20 chars</b>                         |
| 3   | 18 px                | 24 px    | <b>13 chars</b>                         |
| 4   | 24 px                | 32 px    | <b>10 chars</b>                         |
| 5   | 30 px                | 40 px    | <b>8 chars</b>                          |
| 6   | 36 px                | 48 px    | <b>6 chars</b>                          |

The height is Text Size X 8 (?)

# Sleep and Wake up

## Sleep types

- **Light sleep** → handig bij korte pauzes, reageert snel op beweging.
- **Deep sleep** → goed als er langere tijd geen beweging is (bespaart veel stroom).
- **Hibernation** → enkel nuttig als je op batterij werkt en uren/dagen wilt slapen; je moet dan *alles* opnieuw initialiseren bij wake (display, DHT, Wi-Fi, etc.).

| Slaapmodus | CPU actief? | RTC actief? | RAM behouden? | Typisch verbruik |
|------------|-------------|-------------|---------------|------------------|
|------------|-------------|-------------|---------------|------------------|

|                    |                              |                              |  |               |
|--------------------|------------------------------|------------------------------|--|---------------|
| <b>Light sleep</b> | <input type="checkbox"/> Nee | <input type="checkbox"/> Ja  | <input type="checkbox"/> Ja            | ~1-5 mA       |
| <b>Deep sleep</b>  | <input type="checkbox"/> Nee | <input type="checkbox"/> Ja  | <input type="checkbox"/> Nee (RAM weg) | ~0.1 mA       |
| <b>Hibernation</b> | <input type="checkbox"/> Nee | <input type="checkbox"/> Nee | <input type="checkbox"/> Nee           | ~5-10 $\mu$ A |

| Functie            | Deep Sleep               | Hibernation              |
|--------------------|--------------------------|--------------------------|
| Wake via timer     | <input type="checkbox"/> | <input type="checkbox"/> |
| Wake via GPIO EXT0 | <input type="checkbox"/> | <input type="checkbox"/> |
| Wake via GPIO EXT1 | <input type="checkbox"/> | <input type="checkbox"/> |
| ULP / touch wake   | <input type="checkbox"/> | <input type="checkbox"/> |
| RTC memory bewaren | <input type="checkbox"/> | <input type="checkbox"/> |
| Verbruik           | ~100 $\mu$ A             | ~10 $\mu$ A              |

(RTC memory: Klein stukje geheugen dat optioneel behouden blijft tijdens deep sleep.)

## Hoe het werkt

- De ESP32 blijft tijdens **deep sleep** bijna volledig uitgeschakeld.
- Alleen het **RTC-subsysteem (Real-Time Clock)** blijft actief.
- Dat subsysteem bewaakt een klein aantal speciale **RTC GPIO's** (zoals GPIO 0, 2, 4, 12-15, 25-27, 32-39).
- Via **EXT0** kun je precies één van die pinnen gebruiken om wakker te worden.

## EXT0/EXT1

- **EXT0:** slechts **één** pin, **level-triggered** (blijft hoog → blijft wakker).
- **EXT1:** kan **meerdere pins** combineren (OR/AND), **edge-like gedrag** (gaat van low naar high).

```
# EXT0
esp_sleep_enable_ext0_wakeup(GPIO_NUM_13, 1); // Word wakker als pin 13 HIGH wordt

# EXT1
esp_sleep_enable_ext1_wakeup(1ULL << 12 | 1ULL << 13, ESP_EXT1_WAKEUP_ANY_HIGH);
```

## Hibernation

```
# je bereikt hibernation door in deep sleep alle power domains uit te zetten.
esp_sleep_enable_ext0_wakeup(GPIO_NUM_13, 1); // PIR HIGH wekt op
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_OFF); // RTC peripherals uit
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_SLOW_MEM, ESP_PD_OPTION_OFF);
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_FAST_MEM, ESP_PD_OPTION_OFF);

esp_deep_sleep_start(); // gaat in hibernation omdat alles uit is
```

## Deep Sleep wake op PIR (ANY\_HIGH)

```
#include <esp_sleep.h>

#define PIR_PIN 13 // RTC-capable pin

void setup() {
  pinMode(PIR_PIN, INPUT); // of INPUT_PULLDOWN als je die wilt gebruiken
  // Wake bij HIGH op deze pin (EXT1, multiple pins mogelijk)
  esp_sleep_enable_ext1_wakeup(1ULL << PIR_PIN, ESP_EXT1_WAKEUP_ANY_HIGH);

  // ... event. nog iets loggen

  esp_deep_sleep_start();
}

void loop() {}
```

## Light Sleep wake op PIR

```
#include <esp_sleep.h>

#define PIR_PIN 13

void setup() {
  Serial.begin(115200);
  pinMode(PIR_PIN, INPUT);
  esp_sleep_enable_ext1_wakeup(1ULL << PIR_PIN, ESP_EXT1_WAKEUP_ANY_HIGH);
}

void loop() {
  // Doe je werk...
```

```
delay(50);

// Ga naar light sleep tot PIR HIGH wordt
esp_light_sleep_start();

// Wakker! (PIR hield de lijn even hoog; verwerk event)
Serial.println("Motion detected (woke from light sleep)");
// kleine debounce
delay(200);
}
```

# PIR Motion Detector Module

## *PIR Motion Detector Module*

## Trigger Modes L & H

If you move the jumper to L position the sensor will 'toggle' (change state) every time motion is detected - probably providing the on-board timer has timed out. This is unlikely to be of much use in a practical application. (Watch the comments for corrections!)

Moving the jumper to the H position will result in the more usual sensor logic. The sensor will turn on when motion is detected and turn off some time after the last motion is detected. This sensor will reset the timer (which would otherwise turn the output off) every time motion is detected and would be suitable, for example, for room occupancy lighting control where you don't want the lights to blink off while the unit resets.

## Delay

Clockwise turn makes it more sensitive.

## Sensitivity

clockwise turn makes it more sensitive.
