

8, Login / rollen

In onze tweede web app, de student database gaan we een login maken. Als je aanlogt als beheerder dan mag je de cijfers invoeren, veranderen of deleten.

models/Users.php

```
private static $users = [
    '100' => [
        'id' => '100',
        'username' => 'admin',
        'password' => 'admin',
        'authKey' => 'test100key',
        'accessToken' => '100- token',
        'role' => 'admin',
    ],
    '101' => [
        'id' => '101',
        'username' => 'user',
        'password' => 'demo',
        'authKey' => 'test101key',
        'accessToken' => '101- token',
        'role' => 'user',
    ],
];
```

In controller

```
public function behaviors()
{
    return [
        'access' => [
            'class' => AccessControl::className(),

            'rules' => [
                [ 'actions' => ['index','view'],
                'allow' => true,
```

```

        'roles' => ['@'] // any authenticated user, use ? for guests
    ],

    [ 'actions' => ['create', 'update', 'delete', 'overzicht'],
      'allow' => true,
      'roles' => ['@'],
      'matchCallback' => function ($rule, $action)
      {
          return (Yii::$app->user->identity->role == 'admin');
      }
    ],

    ],

    ],
];
}

```

via Init method in Controller (replaces the __construct)

```

// if user object does not exist or it exists but is anything but admin, go to login screen
public function init() {
    if (! isset(Yii::$app->user->identity->role) || Yii::$app->user->identity->role !=
'admin') {
        $this->redirect(['/site/login']);
    }
}

```
